## Addition Rule

Mutually exclusive events have no outcomes in common

$$
P\left(A^{\wedge} B\right)=P(A)+P(B)
$$

$$
P\left(A^{\wedge} B\right)=P(A)+P(B)-P\left(A^{\wedge} B\right)
$$

2. Timothy is asked to determine the P (iPod or iPhone). He adds the column P (iPad) $=30 / 72$ to the row $\mathrm{P}($ (iPhone) $=55 / 72$ and gets 85/72. Because this number exceeds 1 he knows that he has done something wrong. What did he do wrong?
