By convention, we normally write our rules in terms of $x$

$$
\frac{y-15}{2}=f(y) \text { as } \quad \frac{x-15}{2}=f(x)
$$

But, that's confusing having $2 \mathrm{f}(\mathrm{x})^{\prime} \mathrm{s}$
So we create new notation, identifying the inverse as

$$
\begin{aligned}
& f^{-1}(x)=\frac{x-15}{2} \\
& \text { That is read the inverse of } \mathrm{f} \text { is } \frac{x-15}{2} .
\end{aligned}
$$
